

Biomimetic Crowns

A natural way to restore and protect your tooth

A biomimetic crown is a modern crown designed to copy the strength, flexibility and behaviour of a natural tooth. The word **biomimetic** means “designed to copy nature”. Rather than drilling away healthy tooth to fit a cap, it preserves as much of your natural tooth as possible.

THE BENEFITS

- ✓ **Preserves healthy tooth structure** – only the damaged part is treated
- ✓ Less pain and sensitivity after treatment
- ✓ May help avoid more invasive treatment such as root canals
- ✓ Well suited to cracked, worn or heavily filled teeth
- ✓ Lower risk of future decay thanks to a strong bonded seal
- ✓ Biocompatible, natural-looking materials

Is it right for you? Biomimetic crowns suit teeth that are damaged or heavily filled but still have enough healthy structure to preserve. Ask our team at your next visit, or call us – we're happy to talk through the most conservative way to restore and protect your tooth.
